Abstract

An object of the present invention is to provide a network measurement configuration apparatus which selects an IP meter for measurement traffic of a network, and sets a measurement rule in the IP meter.

In order to achieve the above object, there is provided a network measurement configuration apparatus connected to a network having a plurality of measurement devices arranged therein, which measures traffic data of the network based on a measurement rule, comprising, a receiving means which receives a user request including path information and a measurement type, a measurement device selecting means which selects a measurement device responsible for a measurement based on the user request, and a measurement rule setting means which sets a measurement rule in the measurement device thus selected.
